Garamond & Helvetica

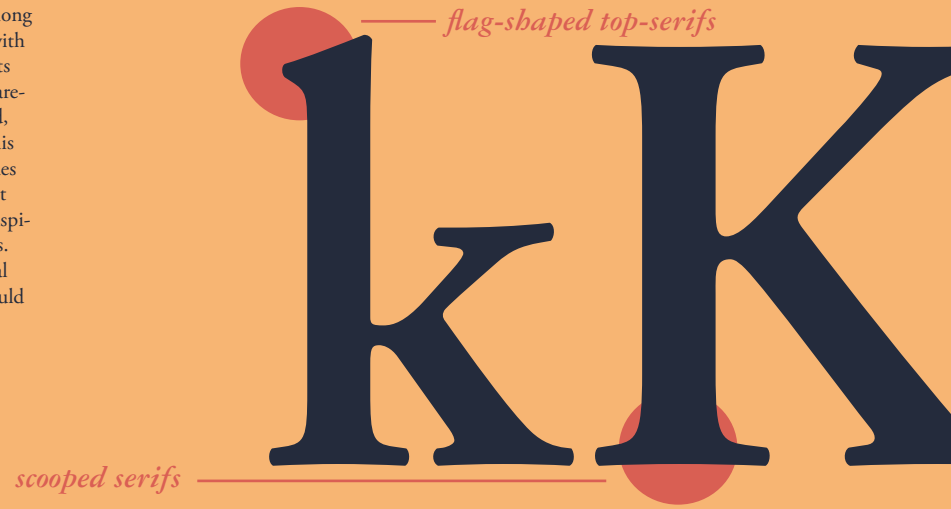
Garamond

A typeface created to be timeless, elegant and classy.
Garamond has been admired and became an inspiration.

the designer:

Garamond was named for the French punch-cutter Claude Garamond. Punches, are long slender metal rectangles with letterforms carved into its ends, which Garamond carefully crafted and perfected, later surviving him after his death. Garamond's punches found its way to different foundries and served as inspirations for many typefaces. Garamond was intentional in creating letters that would read better when printed.

Claude Garamond



The ***shoulder*** is the curve often letterforms. The ***ascender*** is the upward part within a letterform that extends above the x-height. The ***finial*** is a curved end of a stroke that has no serif. ***X-height*** is the height of the body of a lower-case letter, excluding ascenders and descenders.

The ***cap height*** is the distance from the baseline to the top of the capital letter. This determines the point size.

A ***ligature*** is when two or more letters are joined to create a glyph. A ***descender*** is the part of a letterform that extends below the baseline.

*The ***spine*** is the primary curved stroke seen in the letterform 's'. The ***bowl*** is the rounded and enclosed part of various lowercase letterforms. A ***serif*** is small line or stroke attached at the end of larger strokes.

Old-style vs Neo-grotesque

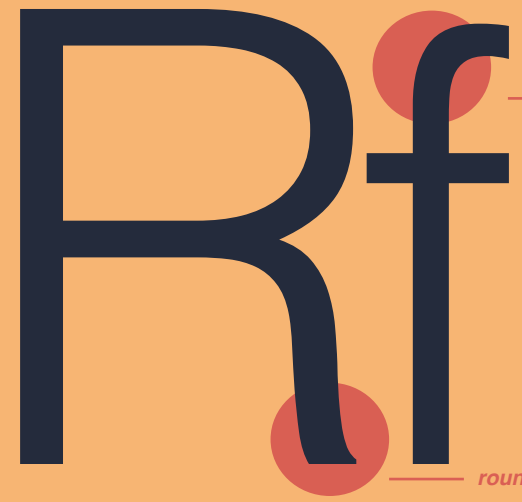
+The ***baseline*** is the line where letters sit. An ***overhang*** is an extension of a circular character or glyph slightly beyond the baseline to give an optical illusion in size compared to other glyphs.

contrasting Garamond and Helvetica:
The main contrast between Garamond and Helvetica comes with its line thickness. Helvetica overall has a consistent uniform thickness within each letterform. Garamond, and its serifs, has variety and is gradual in its thickness.

Helvetica

the designer:

Max Miedinger

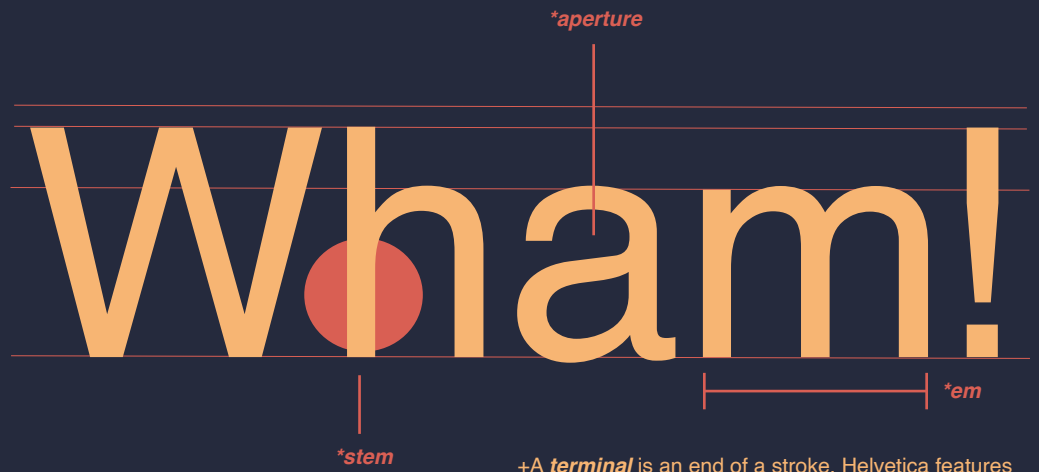


Helvetica's origin comes from Switzerland, with the name being derived from 'Helvetia' meaning 'Switzerland' in Latin. Freelance designer Max Alfons Miedinger was commissioned to create a new font. Originally named Neue Haas Grotesk, Miedinger created a new set of sans serif glyphs designed to be linear, simple, and elegant.

Helvetica has features that contribute to its neutrality and boldness; perfect negative space surrounding each letter and line and strokes that are only horizontal or vertical- never diagonal.

A neutral and clean typeface loved by many. Undoubtedly one the most popular fonts in the mid-20th century.

*A ***stem*** is the vertical, full length stroke in upright characters. An ***aperture*** is partially enclosed, rounded negative space within various characters. ***Em*** is the unit of measurement for the size of a font or point size.



+A ***terminal*** is an end of a stroke, Helvetica features straight terminals. The ***apex*** is the point at the top of a letterform where two strokes meet. A ***cross bar*** is the horizontal stroke in letters. ***Counters*** are the open space in a full or partially closed section within a letter.

Helvetica features a taller x-height than other typefaces, making it easer to read at small sizes and from a distance. The typeface also remain legible in motion, making it popular for airline logos.
